BlueStacks announced today that it will expand the small stealth development of a program that allows users with x86 PCs to run the Android Rosen Sharma app. BlueStacks CEO explains a little more: the immediate arrival at Q3 of this year's BlueStacks will work with the x86 desktop, notebook or tablet that Microsoft Windows' last bits are interesting, as on their website, BlueStacks claims that The ViewSonic ViewPad 10 pro (Windows 7/Android devices will soon) be powered by their technology. BlueStacks' business models are like Swype's - they strive to integrate by OEMs into new products instead of selling their software standalone. Android emulation on Windows is not new. We see it from RIM on the Playbook, if BlueStacks can pull it out smoothly and without lag, as they claim, that would be a real trick. We have signed up to receive their initial list of testers and until the jury is still out. READ MORE: BlueStacks.com led by former SVP and CTO's Innovation for McAfee Security Company \$7.6 million Series A financing to develop a single software to run Android applications on Windows, creating a multibillion-dollar opportunity for PC manufacturer SAN FRANCISCO--(BUSINESS WIRE)--BlueStacks Emerged from stealth mode today to announce that it has secured \$7.6M in Series A financing from Ignition Ventures, Radar Partners, Helion Ventures, Redpoint Ventures and Andreessen Horowitz to further develop groundbreaking technology that will allow users to run smoothly. Simultaneous use of Android applications on Windows, combined with multi-touch activation, gives users the opportunity to quickly access personal and running applications while giving PC manufacturers the opportunity to take advantage of the growing consumer demand for Android-based mobile enterprise applications, founded in March 2008, with the goal of taking advantage of the fast-growing Android OS market and the need for users to carry two devices. BlueStacks will help consumers benefit from both Android and Windows for the cost of a single PC. BlueStacks, led by CEO Rosen Sharma, serial operator and the latest SVP and CTO of innovation at McAfee, in addition to Sharma, Frank Artale of Ignition and Kevin Compton from Radar, also joined the board of directors. Ignition sees a clear need for what BlueStacks can deliver: how to help businesses of all sizes and consumers take advantage of the devices selected for work and play. I look forward to working with the team during a period of excitement in bluestacks. PC manufacturers are riding the momentum behind the Android ecosystem by enabling Android apps to run on tablets, netbooks, notebooks or all-in-one (AIO) computers with a new open-top factor form. This allows PC manufacturers to increase profit margins on devices and also benefit from an increase in customer lifetime value due to the purchase of all applications and toughness that comes from user data and settings. It's an interesting strategy for BlueStacks to enable all popular Android apps on Windows devices for consumers and businesses alike, this means getting the best out of both worlds with the ability to run Android apps on Windows devices that provide all the advantages of familiarity, device compatibility and security. Add Sharma, our vision for a whole new kind of experience that supports consumer interest in Android and also gives them access to some of the most valuable enterprise applications, allowing them to use their devices of choice for work and play. BlueStacks is now working with many OEMs and strategic partners and hopes to bring our products to market in the third quarter of this year. For more information, visit www.bluestacks.com BlueStacks, if you're dying to run the Android app on your Windows machine, you'll need to check out the recently released BlueStacks App Player beta, the Android app emulator for Windows XP, Vista, and 7. Software gives you access to Android apps on the Android market, GetJar, Amazon AppStore or iMobile Market, and allows you to run it on your desktop. You can also use the Companion Android app to download the same apps you have on your Android device to your computer and receive SMS messages sent to your phone on your PC. If you want to try BlueStacks, here's how to get started, download bluestacks page to download the App Player beta grab from the BlueStacks website by clicking the button. Download now On the landing page, run the .EXE file if your computer does not have a .NET file. 3.5 You will be prompted to download the utility before app player installs it, the program takes a few minutes to install, as it grabs most of the app's necessary files and other data. Setting up BlueStacks with your Android phone, the setup process is quite straightforward, but Android smartphone owners will need to make sure they click the options button. Yes, say they have an Android phone, then you will be notified for your email address and phone number, including country code, then BlueStacks will send you an email and SMS message detailing how to sync your phone with the App Player. In my test, I did not receive an SMS, but all the information I needed to sync my device is in email. BlueStacks App Player's start screen contacts you, enters your Android device details, you're ready to go, and you can start using the app. By default, you get a number of apps to try right away, such as Barnes & Noble's Nook, Documents To Go, Evernote, Fruit Ninja Free, Pulse and StumbleUpon. To return to the Start screen of the App Player, click the BlueStacks icon in the center of the navigation bar at the bottom of the App Player window, download the new app to download the app from the Android app store, just enter the name of the app into the search bar found below your app gallery. You can download almost anything you can use on your phone. However, some messaging apps may not work. I use the WhatsApp Messenger messaging service, for example, to communicate with friends and family around the world, but in my experiment, WhatsApp won't work using the New App Player. To use it, just enter a name in the search bar and press Search App Player, grab the app from Google Play, but you can also download the app from other app stores, including the Amazon Appstore for Android. If you want to receive SMS messages and place the same app on your phone into the Player app on your desktop, you need to download the BlueStacks Cloud Connect companion app from Google Play. You can also find a PIN on the App Player by clicking the Settings icon in the lower-right corner of the navigation bar, then on the next page, select Cloud Connect, and a pop-up window will appear with a Cloud Connect PIN quite straightforward to use: you just need to select the app you want. Sync with the App Player and press the Sync button at the top of the screen. If you want to sync all apps to your desktop, tap the box next to the Sync button, even if it's called Sync. For example, the logon information must be re-entered by Windows 8App. If the Windows Store doesn't have the Metro-style app you want to use, the only downside is that you'll use the Android app at the top of the traditional Windows desktop environment. I briefly tested BlueStacks that worked in Windows 8 Consumer Preview and it worked as expected. I also tried App Player on Vista with Intel Pentium T3400 RAM and 2GB dual-core 2.16 GHz during the app player trial, much faster, but far from smooth. However, please note that this is a beta product and is likely far from conclusive.
